

PROPOSED SOLUTION :

- ① "Create a genuine quantum signature" using quantum teleportation.
- ② "Remember what a genuine signature should look like" mathematically.
- ③ When someone sends a signature, the system. "checks it against the genuine one".
- ④ If everything looks normal → ACCEPT.
- ⑤ If something looks slightly strange → SUSPICIOUS.
- ⑥ If the difference is too large or someone tries to reuse/forgery it → REJECT.
- ⑦ We will also "**simulate attacks**" such as forgery, replay, and impersonation to prove that our system can detect them.
- ⑧ A "**React dashboard**" will show all of this visually, including the quantum state and attack results.
