

**Feasibility:**

- Uses open-source tools like Python, Qiskit, and Qiskit Aer.
 - Can be developed and tested on a normal computer without a real quantum computer.
 - The mathematical calculations and attack simulations are practical to implement.
 - React and FastAPI make the final system easy to integrate
-

Viability :

- Can be expanded gradually from simulation to real quantum hardware.
- The framework can be adapted for future quantum communication and QDS systems.
- It does not depend on AI/ML, reducing complexity and training requirements.
- The modular design allows new attacks, measurements, and security rules to be added later.
